## Marx and Criticism of Technology

Zheng Fei

**Abstract:** Basically, Marx took a positive attitude toward technology with reservations, that is, actually a dialectic approach which means overcoming the limitations of modernity with the internal transcendence of production technology. Namely, technology becomes an emancipatory power which, however, just comes from the contradiction in itself. This conception of technology has roots in Marx's orientation toward production technology in human activities. In his opinion, means of material production are the basis of existence and development of human society so that production technology, one of typical liberal activities, is always of priority in human activities.

**Keywords:** Marx; criticism of technology; modernity
